New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beter-subunits to improve stability

Disclosure; Fig 3B; 139pp; English.

Disclosure; Fig 3B; 139pp; English.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hLH), human chorionic gonadotropin (hCG), human luteinising hormone (hHH), human chorionic gonadotropin chormone (hFSH), human hygoid stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence corresponding for the generation of the improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHS and prolong the blological activity on them. The changes stabilise the GPHS and prolong the blological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hCG analogue alpha-subunit alpha-C375,K51C.
Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulphide crosslink between the alpha- and beta-subunits to improve stability
Disclosure; Fig 31A; 139pp; English.
The invention relates to the production of analogues of a heterodimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        93.2%; Score 137; DB 1; Length 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The wew standings of particularity has a new standing by the constitution of the constitution relates to the production of analogues of a heterodimeric the invention relates to the production of analogues of a heterodimeric consumity glycoprotein hormone (GPH) e.g. human chorionic gonadotropin to the invention between the production of the contain of the contain of the contain an intersubunit disulphide bond, hormone (hFSH), human thyroid stimulating hormone (hFSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bloactivity for the corresponding native GPH receptor. This sequence conceptions and the corresponding and the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and parolong the bloace of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pouq;
                                                     agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-JUN-1999 (first entry)
hCG analogue alpha-subunit alpha-C7A.
hCG analogue, heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotropin; human luteinising hormone; disulphide bon human follicle stimulating hormone; human filyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                Gaps

subunit glycoprotein hormone (GPH) e.g. human chorionic gonadotropin (hCG), human luteinising hormone (hHS), human follicle stimulating hormone (hFSH), human thyroid stimulating hormone (hTSH), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for improved stability, the analogue retaining at least a portion of the bioactivity for the corresponding native GPH receptor. This sequence represents a mutant hCG-alpha subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table IX: Page 68: 94pp; English.

Table IX: Page 68: 94pp; English.

The sequence is an analogue of mature hCG alpha subunit having several residues replaced by the corresponding residues in the bovine sequence and residues 34-61 deleted. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive with other can also provide an alternative seugence to place in human hormones in the challent the properties of the molecule.

Table IX; Page 68; 94p; English.

Table IX; Page 68; 94p; English.

The sequence is an analogue of mature hCG alpha subunit having several residues replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive wth other naturally occurring glyco-protein hormones will not be produced. It may also provide an alternative seugence to place in human hormones to alter the proper-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for that construction of hormone dimers that can be used as immunogens su protein hormones will not be produced. It may also provide an alternative sequence to place in human hormones to alter the proper-

Hybrid dimeric protein comprising two co-expressed units - each based on receptor or ligand and a subunit of a heterodimeric hormone, especially FSH, for inducing follicular maturation Example; Pages 37-38; 60pp; English.

Skample; Pages 37-38; 60pp; English.

Cacid sequences, each comprises 2 dimer forming co-expressed amino acid sequences, each consisting of a homodimeric or heterodimeric comprises 2 dimer forming activity, bound directly or via a peptide linker to a subunit of a heterodimeric protein hormone capable of forming a heterodimer with the hormone's other subunits. The fusion protein, e.g. the hormone's other subunits. The fusion protein, e.g. the component (TPO)/human chorionic gonadotrophin-alpha subunit of thrombopoietin (TPO)/human chorionic gonadotrophin-alpha subunit component, reducing the requirement for hormone itself and the number of injections needed.
bound directly or via a peptide linker to a subunit of a heterodimeric protein hormone capable of forming a heterodimer with the hormone's other subunits. The fusion protein, e.g. the thrombopoietin (PPO)/Numan chorisonic gonadotrophin-alpha subunit (hCG-alpha) fusion protein denoted by the present sequence, significantly increases the biological activity of the hormone component, reducing the requirement for hormone itself and the sequence 256 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TBP(20-190)/hCG-alpha fusion protein.
Fusion protein; thrombopoietin; TPO; human chorionic gonadotrophin;
alpha subunit; hCG-alpha.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New giyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table IX; Page 68; 94pp; English.

The sequence is an analogue of mature hCG alpha subunit having several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive with other naturally ocurring giyco-protein hormones will not be produced. It may also provide an alternative sequence to place in human hormones to alter the proper-

The sequence is an analogue of mature hCG alpha subunit having several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind lH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive wth other naturally ccurring glycoprotein hormones will not be produced. It may also provide an alternative seugence to place in human hormones to alter the properties of the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table IX; Page 68; 94pp; English.

The sequence is an analogue of mature hCG alpha subunit having several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for that antibodies cross-reactive with other naturally occuring glyco-protein hormones will not be produced. It may also provide an alternative seugence to place in human hormones to alter the properties of the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New glyco-protein hormone analogues - for inducing fertility a immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines rable IX; Page 68; 94pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                  and bind if receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive with other naturally ocurring glycoprotein hormones will not be produced. It may also provide an alternative seugence to place in human hormones to alter the proper-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     alternative seugence to place in human hormones to alter the properties of the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive with other naturally ocurring glycoprotein hormones will not be produced. It may also provide an
                                                                                                                                                                                                                      immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
Table IX; Page 68: 94pp; English.
The sequence is an analogue of mature hCG alpha subunit having several residues replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glyco-protein hormone analogues-- for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table IX; Page 68; 94pp; English.

development and as immuno-contragestive vaccines.

Table IX; Page 68; 94pp; English.

The sequence is an analogue of mature hCG alpha subunit having several residues at the N-termila replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind IM receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive with other naturally ocurring glycopretan hormones will not be produced. It may also provide an alternative sequence to place in human hormones to alter the proper-
                                                                                                                                                                                                                                        ties of the molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New girco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Table IX; Page 68; 94pp; English are contraged as immuno-contragestive vaccines.

The sequence is an analogue of mature hCG alpha subunit having several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens that antibodies cross-reactive with other naturally ocurring glyco-protein hormones will not be produced. It may also provide an elective of the molecule.

New glyco-protein hormone analogues - for inducing fertility as New glyco-protein hormone analogues - for inducing fertility as New glyco-protein hormone analogues - for inducing fertility as New glyco-protein hormone analogues - for inducing fertility as New Gist, 34pp; Bng1sh.

Table IX; Page 68; 34pp; Bng1sh.

The sequence is an analogue of mature hCG alpha subunit having several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive wth other naturally ocurring glyco-protein hormones will not be produced. It may also provide an ties of the molecule.

several residues at the N-terminal replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive wth other naturally ocurring glyco-protein hormones will not be produced. It may also provide an alternative seuqence to place in human hormones to alter the properties of the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant ovine follicle stimulating hormone - used for induing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               increasing ovulation in female animals and improving yield of ova. Disclosure; Fig 1b; 22pp; English.

The clone was isolated from a cDNA library prepd. from RNA extracted from lamb pitultary glands. The DNA is used to produce the protein by recombinant techniques. The protein can be used control ovulation and improve embryo viabilty in sheep and goats.
                                                                                                                                                                                                                                                                                                                                                                                              Table IX; Page 68; 94pp; English.
The sequence is an analogue hor necestration against the suppression reproductive system development and as immuno-contragestive vaccines.

Table IX; Page 68; 94pp; English.
The sequence is an analogue of mature hCG alpha subunit having the sequence is an analogue of mature hCG alpha corresponding.
                                                          11-FEB-1992 (first entry)
hCG/DCG alpha subunit chimera, H8.
Glycoprotein hormone; human chorionic gonadotropin; bovine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              57.8%; Score 85; DB 1; Length 96; 57.1%; Pred.                                                                                                                                                                                                             Polypeptide corresp. to glycoprotein hormone alpha-subunit - useful for Disclosure; page 7; 40pp; English.
inhibiting thyroid stimulating immunoglobulin in Graves disease.
The peptide corresp. to amino acids 1 to 15 of the human glycoprotein hormone subunit, and is one of a series of 10 synthetic peptides each verlapping each other by 5 aa's together covering the complete 92 as sequence of the alpha subunit. The peptides are used to inhibit TSI.
Diock TSH, LH and hCG binding to receptors, and inhibit TSH-mediated cAMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 several residues replaced by the corresponding residues in the bovine sequence. The subunit will combine with hCG beta subunit and bind LH receptors. The chimera may be useful for the construction of hormone dimers that can be used as immunogens such that antibodies cross-reactive wth other naturally ocurring glyco-protein hormones will not be produced. It may also provide an alternative seugence to place in human hormones to alter the properties of the molecule.

Inhibiting thyroid stimulating immunoglobulin in Graves disease.

The peptide corresp. to amino acids 11 to 25 of the human glycoprotein hormone subunit, and is one of a series of 10 synthetic peptides each hormone hother by 5 aa's together covering the complete 92 as sequence of the alpha subunit. The peptides are used to inhibit TSI, block TSH, LH and hCG binding to receptors, and inhibit TSH-mediated cAMP
                                                                                                                                                                                                                                                                                                                                                                                 Synthetic glycoprotein hormone alpha subunit peptide.
Glycoprotein hormone; alpha subunit; thyroid stimulating immunoglobulin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Fig 1: 21pp; English.

Nucleotide G377 of 003820 was deleted to encode this amino acid sequence as given in the specification.

A mammalian cell may be cotransformed with a vector contg. the sequence encoding this protein and a second vector contg.a sequence encoding this protein and a second vector contg.a sequence encoding culturing the cell form hybrid dimers which act as hormone superagonists. These are useful for inducing super-ovulation of
                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    22-AUG-1990 (first entry)
Equine alpha subunit of gonadotropin hormone.
Gonadotropin; hormone; alpha subunit; horse; chimeric super-agonist;
HCG; FSH; TSH; LH; super ovulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-MAR-1990.

Recombinant truncated equine chorionic gonadotropin hormone - has enhanced follicle-stimulating hormone activity and reduced luteinising hormone activity; useful as ovulation inducer claim 2, Page 10; 16pp; Japanese.

This is the alpha-subunit of an equine chorionic gonadotropin (eCG) hormone. The rompone is composed of alpha and beta-subunits of eCG hormone in which a C-terminal peptide is removed from the beta-subunit. It has a substantially enhanced follicle-stimulating hormone (FSH) activity and reduced luteinising hormone (LH) activity. The hormone is an ovulation inducer and can be used as an agent for the treatment of ovarian diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-MAY-1998 (first entry)
Equine chorionic gonadotropin (eCG) hormone alpha-subunit.
Equine, chorionic gonadotropin, hormone; eCG; alpha-subunit; treatment; follicle-stimulating hormone; FSH; luteinising hormone; LH; ovulation; ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Equine chorionic gonadotropin (eCG) hormone alpha-subunit.

Witant equine chorionic gonadotropin hormone - has substitution in alpha chain preventing binding of sugar to residue 56, resulting in loss of luternising hormone activity.

Claim 3; Page -; 15pp; Japanese.

Claim 3; Page -; 15pp; Japanese.

This is a variant of the alpha-subunit of equine chorionic gonadotropin (eCG). The wild type amino acid Asn at position 56 is replaced by Gln.

This variant has an amino acid substitution to inhibit binding of a sugar chain to 56th amino acid resulting in loss of luteinising hormone (LH) activity. A variant gonadotropin hormone composed of the variant alphaseulouit and beta-subunit of eCG is a safe and widely applicable ovulation inducer and may be used as an agent for the treatment of ovarian
                                                                                                                                                                                                                                                                                             ï

Mutant equime choritonic gonadotropin hormone - has substitution in alpha chain preventing binding of sugar to residue 56, resulting in loss of lutenising hormone activity

Claim 2, Page 9; 15pp, Japanese.

This is the alpha-subunit of equime chorionic gonadotropin (eCG). A variant of this alpha-subunit has an amino acid substitution to inhibit binding of a sugar chain to 56th amino acid resulting in loss of lutenising hormone (LH) activity. A gonadotropin hormone composed of the variant alpha-subunit and beta-subunit of eCG is a safe and widely applicable ovulation inducer and may be used as an agent for the treatment of ovarian diseases. This gonadotropin hormone is substantially free from LH activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Amino acid at this position is Thr or Ser if amino acid at position 56 is not Asn; amino acid at this position is not Thr or Ser if amino acid at position 56 is Asn; amino acid at this position is Thr if amino acid at cost is a factor of the cost of the cos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "If amino acid at this position is Asn, then amino acid at position 58 is any other amino acid except Thr or Ser; if at this position is an amino acid any other than Asn, then at position 58, the amino acid is Thr or Ser; if amino acid at this position is Gln, then amino acid at position 58 is Thr.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Equine chorionic gonadotropin alpha-chain protein.
Chorionic gonadotropin alpha chain; equine; eCG; luteinising hormone;

This sequence represents the equine chorionic gonadotropin (eCG) alpha chain. This sequence is used in a method which results in a recombinant eCG having the alpha-chain fused to the C-terminal side of the beta-chain. The encoded polypeptide has similar luteinising hormone (LH) activity to the naturally occurring or wild-type eCG but about seven times greater than follicle-stimulating hormone (FSH) activity. The polypeptide is used in the treatment of fertility disorders in animals including domestic animals (e.g. cow, pig, sheep or horse), such as multiple ovulation, ovulation inhibition, ovarian tumours, the timing of coming on heat after sequence 120 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Equine chorionic gonadotropin alpha and beta chain fusion protein. Claim 1; Page 14-15; 26pp; Japanese.

This sequence represents a fusion protein composed of the equine choiconic gonadotropin (eGG) alpha chain fused to the C-terminal side of the beta-chain. The encoded polypeptide has similar luteinising hormone (LH) activity to the naturally occurring or wild-type eGG but about seven times greater than follicle-stimulating hormone (FSH) activity. The polypeptide is used in the treatment of fertility disorders in animals including domestic animals (e.g. rat, mouse, rabbit) and farm animals including domestic animals (e.g. rat, mouse, rabbit) and farm animals including vovarian tumours, the timing of coming on heat after sequence 265 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1;

18 activity. The GPH agonists can be used to treat, e.g.

18 care's disease, thyroid cancer, ovulatory disfunction, luteal.

18 phase defect, unexplained infertility, male factor infertility and time-limited conception. They can also be used in the super-ovulation of bovine animals. The modified GPH can also be used to target delivery of therapeutic agents to thyroid or gonadal tissue, or in the treatment of certain neophasms. The modified GPH can activity which is increased by at least 3-fold compared to wild-type GPH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    alpha-subunit mutant, was used in a novel method for the preparation of a human glycoprotein hormone (GPH), comprising a basic amino acid in the alpha-subunit at positions 11,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New modified glyco-protein hormones - having amino acid
substitutions from one species in another species to produce
products having super-agonist or antagonist activity
Example: Fig 1: 90pp: English.
The present sequence, a human thyroid stimulating hormone (TSH)
                                                                                                                                                                                                         14-MAY-1998 (first entry)
Human TSH alpha-subunit mutant Gln2OLys.
Human; thyroid stimulating hormone; TSH; alpha-subunit;
glycoprotein hormone; GPH; super-agonist; antagonist; mutant.

The sequences given in R54671-74 represent the alpha and beta chains of the fish gonadotropin hormone (GTH). The DNA encoding these sequences are produced by PCR using DNA extracted from postovipository pink salmon trout pituitary. GTH may be produced by transforming a host organism with these sequences and collecting the protein from the culture medium. The GTH produced may be used for the promotion of maturation and oviposition in fish and other animals.

New modified glyco-protein hormones - having amino acid
substitutions from one species in another species to produce
substitutions from one species in another species to produce
substitutions from one species in another species to produce
Trample; Fig 1: 90pp; English.

The present sequence, a human thyroid stimulating hormone (TSH)
alpha-subunit mutant, was used in a novel method
for the preparation of a human glycoprotein hormone (GPH),
comprising a basic amino acid in the alpha-subunit at positions 11,
13, 14, 16, 17, and 20.

The method can be used to obtain GPH having super-agonist or
antagonist activity. The GPH agonists can be used to treat, e.g.
Grave's disease, thyroid cancer, ovulatory disfunction, luteal
time-limited conception. They can also be used in the
super-ovulation of bovine animals. The modified GPH can lissue, or in the treatment of certain neoplasms. The modified GPH
can have an activity which is increased by at least 3-fold compared
to vild-type GPH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Grossman M, Szkullinski MW, Weintraub BD;

time-limited conception. They can also be used in the super-ovulation of bovine animals. The modified GPH can also be used to target delivery of therapeutic agents to thyroid or gonadal tissue, or in the treatment of certain neoplasms. The modified GPH can have an activity which is increased by at least 3-fold compared to wild-type GPH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Human TSH alpha-subunit mutant Prol6Lys/Gln2OLys/Gln13Lys.

Human; thyroid stimulating hormone; TSH; alpha-subunit;

glycoprotein hormone; GPH; super-agonist; antagonist; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                          Length 12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 53; DB 1; Length 12; Pred. Residue 1 corresponds to residue 1558 of intact plasma fibronectin. Peptides I-VI are fragments of the 33xD carboxy-terminal (t.C33) hepatin-binding region of fibronectin A chain. They promote neurite extension, promote adhesion and spreading of endothelial and melanoma cells and/or promote adhesion of hepatin to synthetic substrates. They may be useful for assisting nerve regeneration, promoting wound healing and implant acceptance, promoting cell attachment to culture substrates, inhibiting metastasis of malignant cells and/or binding excess hepatin in vivo in hepatin therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The alpha4betal integrin is a lymphocyte receptor for the C-terminal cell binding domain (CTCBD) of fibronectin which comprises adhesion sites in Hep2 and a high affinity site, CS-1, in the type III connecting segment or V (for variable) region. Using a series of peptides derived from CS-1, the tripeptide Leu-Asp-Val (LDV) is identified as a minimal peptide capable of supporting stable Sequence 46 AA;

PN binds to fibrin, heparin and Staphylococcus aureus, and may be used to target a therapuetic agent onto natural fibrin eg. a blood clot. It may also be used in affinity purification of a polypeptide, conjugated to the collagen binding site of FN and immobilised on a collagen surface.
                                                                                                                                                                                    N-PSDB; N/0595.
New fibronectin polypeptide sequence with affinity for collagen
                                                                                                                                                                                                   etc. - useful for targetting therapeutics useful for use in affinity purificn. of polypeptide(s) etc. Claim 11; Fig 3A; 32pp; English.

The product may be expressed from a transformed micro-organism.
                                                         Human fibronectin gene product.

Human fibronectin (R92778) has a fibrin-binding site, close to the Cterminus (amino acids 2123-2232 or 2141-2230), covering the 10F1.11F1 module pair of the protein. Fibrin-binding sites can be prepd. by enzymatic cleavage of fibronectin, peptide synthesis or by recombinant DNA techniques. They are used to detect a fibrin-binding target site, to treat disorders involving abnormal fibrinolysis or fibrinogenesis, to disrupt blood clots and to aid delivery of medicaments to fibrin-conty. Sites. They show high affinity to and slow dissociation from fibrin, and provide fast diffusion and rapid clearance.
                                                                                                                                                                                                   530. .56

Disclosure; Fig 2; 191pp; English.

The amino acid sequence is that of human fibronectin, this can be used to derive polypeptides which are identical to part of the fibrin-binding domain (FBD) of fibronectin. These polypeptides can be used to inhibit thrombus formation; or (coupled to a thrombolytic agent) to induce thrombolysis, or to treat wounds, e.g. in skin, eyes or tendons (in conjunction with a polypeptide which includes a part of the cell-binding domain (CBD) of fibronectin). These polypeptides are used to inage fibrin-contg. materials, esp. a thrombus or atheroscience fibrin-contg. materials, esp. a thrombus or atheroscience 2327 AA;
                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fibrin binding domain polypeptide(s) - useful in imaging fibrin-contg. substances, to inhibit thrombus formation and treat

Comprises as 2-926, 928-1338 and especially 2-1336 of the sequence comprises: as 2-926, 928-1338 and especially 2-1336 of the sequence given in R60019; the heparin-binding domain (as 1812-2171 of R60021) of fibronectin; the collagen-binding domain (as 1827-1903 or 1532-1671 of R60020) of fibronectin. DNA encoding a fibronectin-fibringen hybrid is given in 070007, and sequences for fibronectin cand fibrinogen-alpha in 070008 and 070009, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptides which modulate cell migration have the motif IGD - and are useful to stimulate angiogenesis
Disclosure; Fig 5: 57pp; English.
This sequence represents the amino acid sequence of human fibronectin, a widely distributed glycoprotein present in extracellular matrices. The protein contains the motifs IGDS (W99593) and IGDQ (W99594) which can be used in peptides to stimulate cell migration for wound healing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              periodontal tissue regeneration, anglogenesis, inhibition of tumour invasion and metastasis, and in relation to inflammation or connecti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          33.7%; Score 49.5; DB 1; Length 2477; 42.9%; Pred. TYPICASE-6 complex inhibitory peptides - used to treat mast cell-mediated inflammatory disorders e.g. asthma

PR 437390/337.

TYPICASE-6 complex inhibitory peptides e.g. asthma

PS Disclosure; Pages 36-42; 69pp; English.

CHAS IS the amino acid sequence of fibronectin. The tryptase-6 complex inhibitory peptides of the invention comprise the sequence of a fragment confibration of the fibronectin (residues 1351-1356). Sequences shown in W63160 to W63169 represent mouse mast cell protease (mMCD-6) inhibitors, peptides.

C the fibronectin (residues 1351-1356). Sequences shown in W63160 to W63169 represent mouse mast cell protease (mMCD-6) inhibitors can be used for treating a mast cell-mediated inflammatory disorder. The inhibitors can be used to treat inflammatory disorders including asthma, and inflammatory confirmatory bowel disorder, hyperresponsiveness and inflammatory skin conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-OCT-1998 (first entry)
Amino acid sequence of fibronectin.
Mast cell protease: MCP: mouse; inhibitor; peptide substrate; asthma;
tryptase-6 protein; inflammatory disorder; allergic rhinitis; urticaria;
articoedema: eczematous dermatitis; atopic dermatitis; anaphylaxis,
hyperproliferative skin disease; peptic ulcer; hyperresponsiveness;
inflammatory skin condition; fibronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
